Module Handbook:
Master of Science Astro and Particle Physics

Summer Term 2021

Version: March 2021

Faculty of Science
Department of Physics
Kepler Center for Astro and Particle Physics

Contents

1 Objectives of the Programme

The Master of Science Programme in Astro and Particle Physics is an international research-oriented two year Master programme established by the Kepler-Center of the University of Tübingen. The Kepler-Center is part of the Physics Department within the Faculty of Science of the University of Tübingen. It consists of scientists from three different institutes within the Physics Department: Institute for Astronomy & Astrophysics, Physical Institute and the Institute for Theoretical Physics. The Kepler-Center has a research focus in the areas of Astronomy & Astrophysics, Astroparticle Physics and Particle Physics, and it manages a coordinated PhD-programme with the topic: *Particles, Fields and Messengers of the Universe* with about 30 PhD students. The new Master programme connects science from the fields of particle physics, astrophysics and cosmology and combines different disciplines in experimental and theoretical physics, astronomy and astrophysics. Scientists of the Kepler-Center use various methods to discover the origin, structure and evolution of our universe the properties of elementary particles under extreme conditions. This is one of the research foci of the University of Tübingen (see: Uni-Tübingen-Webpage).

The Southern German region concentrates industrial companies with a strong Hi-Tech component. These and other companies elsewhere have a high demand on well qualified young people with a strong background in natural sciences. Presently many physicists educated at the University Tübingen work in technology oriented companies in this region, and the graduates from this Master programme will find an industrial environment with a strong demand on highly skilled people.

The graduates of this Master programme *Astro and Particle Physics* receive a comprehensive education in experimental as well as theoretical physics with a practical section and they are well prepared for the duties in industry and in other research oriented institutions. The education will be in English throughout which prepares the students for the increasing internationalization in industry and modern society. Due to the various research topics within the Kepler-Center students will obtain an education in a wide variety of topics ranging from experimental, numerical to theoretical.

The focus of the educational programme is put on a distinct quantitative approach as usual in physics, along with the acquisition of essential practical skills (primarily in the lab) with respect to problem sets in the field of $Astro\ and\ Particle\ Physics$. The overall goal of the Master course is to impart solid knowledge and competences to qualify students to independently plan and carry out original scientific research in astro and particle physics and to critically evaluate their findings in comparison with published results. The qualification goals in more detail:

- Our graduates have a sound standing in basic and advanced astro and particle physics covering various research fields including for example theoretical quantum field theory, general relativity, computational astrophysics, experimental neutrino physics, and many others.
- They are capable to critically scrutinize the suitability of specific scientific methods for studying various astro and particle physics related questions. In addition, they will be able to combine different techniques in a meaningful way to also make rather complex physical problems accessible.
- They are able to plan and undertake independently appropriate theoretical and laboratory investigations (collecting, recording and analyzing relevant data sets and combining these with theoretical studies).
- The graduates can present scientific findings of their research orally and in writing. Moreover, in discussions they are skilled to answer scientific questions in a proficient manner. At scientific meetings, they can communicate – in English – with experts in the field and contribute to discussions on current astro and particle physics related topics.

The Master programme is a 2 year consecutive study with a modular structure. Students may join the programme twice a year, for the summer and winter semester. In the first year the students have to attend lectures, seminars and labwork consisting of 60 ECTS credit points. All students have

to take two basic introductory modules *Astronomy & Astrophysics* and *Particle Physics* consisting of lectures and exercises in the first term, which lay the foundations for all students. These are augmented by an obligatory seminar and labwork. In the second term students can choose modules from a variety of different topics. In the second year the students will begin with the scientific work on a research topic of their choice in the areas of the Kepler-Center and finally write their Master Thesis, all together again 60 CP (30 for acquiring research oriented skills and 30 for the Thesis).

1.1 Requirements

To participate in the MSc programme a Bachelor degree in Physics or a similar degree with a minimum grade of B (2,5 on the German scale) is required. The Exam Committee (Prüfungsausschuss) decides about the equivalence of the degree and possibly additional requirements such as additional lectures or lab classes that have to be taken. In case of a too large number of participants a Selection Committee will decide about the acceptance. English is the language of instruction and examination in the Astro and Particle Physics Master degree program. An adequate knowledge of English is required (level B2 of the Common European Framework of Reference for Languages).

2 Module Overview

To complete the program students have to earn in total 120 credit points from a suite of compulsory and elective modules.

2.1 Overview by modules

The following list contains the modules offered within the Master programme *Astro and Particle Physics*.

Module Code	Obligatory / Elective	Module Title	Recommended Semester	Credit Points
APP101	O	Astronomy & Astrophysics	1	9
APP103	O	Laboratory Work	1-2	6
APP104	O	Modern Topics in Astro and Particle Physics	1+2	6
APP102	O	Particle Physics	2	9
APP201	E	Theoretical Astrophysics	1	6
APP202	E	Computational Methods in Physics/Astrophysics	1-2	6
APP203	E	Stellar Physics	1-2	6
APP204	E	General Relativity	1	6
APP205	E	Relativistic Astrophysics	2	6
APP206	E	Star and Planet Formation, Exoplanets	1-2	6
APP211	E	Neutrino Physics	1	6
APP212	E	High Energy Astrophysics	1	6
APP213	E	Cosmology	2	6
APP214	E	Extragalactic Astrophysics and Structure Formation	2	6
APP221	E	Quantum Field Theory	1	6
APP301	O	Module of neighboring Field	2	6
APP401	O	Scientific Specialisation in Thesis Topic	3	15
APP402	O	Methods and Project Planning	3	15
APP403	O	Master-Thesis	4	30

Notes: The first section contains the required modules APP101 - APP104 that consist of a total of 30 CP. The modules APP101 and APP102 are two basic lectures laying the foundations for the Master study. Module APP103 requires practical (laboratory) work and module APP104 contains a Seminar (APP104a) and one Lecture (APP104b) that introduce the students to modern research in the field of astro and particle physics. Sections APP201 to APP221 consist of elective modules where the students have to select modules adding up to a total of 24 CP. These modules consist typically of lectures and exercises that cover topics from astro and particle physics. The students can select any modules from this which allows them familiarize themselves with a broader range of scientific fields offered within this Master programme.

The module APP301 should be taken from neighboring scientific fields - not astro and particle physics. This includes for example advanced modules from the 4-year Bachelor study of Physics (not

listed explicitly in the above table), or other advanced modules from Mathematics. Choices from other fields are also possible but require a decision of the Exam Committee (*Prüfungsausschuss*) on an individual basis. Taking this additional course from a neighboring field will allow the students to acquire knowledge, methods and skills in related scientific areas that will be helpful in their Master research in Astro and Particle Physics, and will teach the students how to cooperate with other disciplines and find joint solutions.

The final part, modules APP401 - APP403, are obligatory and contain the Master Thesis itself (APP403) and two preparatory modules (APP401, APP402) introducing into scientific research.

Grading: At least two of the elective modules APP201-APP221 (a minimum of 12 CP) need to be graded. The final grade of the *MSc. in Astro and Particle Physics* is calculated as 2/3 times the grade of the Master Thesis plus 1/3 times the average grade of compulsory modules A101 and A102 (18 CP) and the graded modules from the elective area (12 CP).

2.2 Sample Study Plan

The following table shows exemplary a sample plan for a possible two year study within the Master programme.

Semester	Modules				
1	APP101 Astronomy & Astrophysics 9 CP	APP103 Laboratory Work 6 CP	APP104 Modern Topics in Astro and Particle Physics 6 CP	APP203 Stellar Physics 6 CP	APP204 General Relativity 6 CP
2	APP102 Particle Physics 9 CP	APP202 Computational Methods 6 CP		APP213 Cosmology 6 CP	APP301 Neighboring Field 6 CP
3	APP401 Scientific Specialisation in Thesis Topic 15 CP		APP402 Method and Project Planning 15 CP		
4	APP403 Master-Thesis 30 CP				

Notes: Module APP104 contains a Seminar (APP104a) and one Lecture (APP104b) and is therefore split over semesters 1 and 2. We encourage students to work and study abroad for some extended time period during their studies in this Master programme. Convenient windows for such stays abroad are the 2nd or 3rd semester.

2.3 Overview by Study Progress and Credit Requirements

The following table gives an overview on the Study Progress (the used abbreviations are explained in the next section)

The allocation of CPs to courses is for information only. Credits are only awarded upon completion of the module.		Assessment				Course			Total	Semester			
		Grading	Type of Exam	Duration	Weight	Contact Hours	Status	Type of Course		The allocation of exams to semesters is a recommendation only. Compulsory allocations are marked as such.			
										1.	2.	3.	4.
									CP	CP	CP	CP	CP
Basic Research in Astro and Particle Physics									30	21	9		
APP101	Astronomy & Astrophysics	g	W	180		6	o	L, E		9			
APP102	Particle Physics	g	W	180		6	o	L, E			9

Total (Credit Points)									120	30	30	30	30

3 Module Descriptions

The following module descriptions give a comprehensive overview of the Astro and Particle Physics Master course (APP). The information compiled reflects the course profiles as of October 2016. The module content, the lecturers as well as single lectures might be subject to changes.

The following abbreviations are used in the individual module prescriptions and in the previous overview of the study progress.

Key	
Grading	g = graded; ng = not graded (pass/fail); ne = no module examination
Type of Exam	W = written exam; O = oral exam; T = term paper; P = classroom presentation, A = assignment / term paper, written report
Duration:	duration of the examination in minutes
Weight:	courses: weighting of the examination grade towards the module grade modules: weighting of the module grade towards the final grade
Contact Hours:	CH; hours spent in the classroom per week during the semester
Status:	o = obligatory; e = elective
Type of Course	L = lecture; S = seminar; E = exercise; T = tutorial, P = practical work, PR = project related research, MT = Master-Thesis
CP:	Credit Points (ECTS Credits)

Notes: Several of the modules described in the following consist of a lecture (L) in combination with exercise (E). This is the most common form of teaching and learning in the field of physics and astrophysics. Typically, it contains independent homework of the students as well as team-working through joint discussions of the (weekly) problem sheets. The results of their homework will have to be presented and discussed by the students in the corresponding exercise classes.

Module Code: APP201	**Module Title:** Theoretical Astrophysics.		**Type of Module:** elective
CP: (ECTS Credits)	6		
Workload: - **Time in Class** - **Self-Study**	Total workload: 180 h	Time in Class: 60 h / 4 SWS	Self-Study: 120 h
Duration:	1 Semester		
Frequency:	Winter semester		
Language of Instruction:	English.		
Forms of Teaching and Learning:	Lecture with exercises.		
Content:	The module deals with the fundamentals of theoretical research in astrophysics, and important applications. This includes: the equations of hydrodynamics, sound waves, shock waves, linearization, magnetohydrodynamics.		
Objectives:	The students will obtain knowledge of important non-linear hydrodynamic processes. They will be able to solve the equations through linearization and make simple applications. The students will solve a series of exercises and apply the methods presented in the lecture to deepen their understanding.

<tr><td>Forms of Teaching and Learning:</td><td colspan="4">In both modules the training will be done via a combination of lectures, seminars by (external) experts, projects and presentations by the students.</td></tr>
<tr><td>Content:</td><td colspan="4">The module includes two parallel series of lectures which can be selected independently. The first sub-module (Gravitational Waves & Neutron Stars) will include the theory of gravitational waves and their applications in astrophysics and cosmology. In the same sub-module a series of lectures on neutron star physics and astrophysics will be offered. The second sub-module (Theoretical and Experimental Tests of Gravity) will include an introduction to post-Newtonian and perturbation approaches to general relativity. This knowledge will be used to study the basic experiments in gravitational physics and the potential extensions of the theory (alternative theories of gravity).</td></tr>
<tr><td>Objectives:</td><td colspan="4">In the first sub-module (Gravitational Waves & Neutron Stars), the students will be trained in combining observational data with theory. The recent discovery of gravitational waves opened a new window into the universe and together with x- and gamma ray observation will provide information for the densest objects in the universe. In parallel, they will get training in the physics, dynamics and astrophysics of the most complicated material objects in the universe, the neutron stars. In the second sub-module (Theoretical and Experimental Tests of Gravity), the students will obtain knowledge of the post-Newtonian and perturbative approximations to gravity, they will learn also the potential alternative's to Einstein's theory and the experiments designed to validate them. The theoretical skills that they will acquire may be used in modern space technology and design.</td></tr>

Module Code: APP212	**Module Title:** High Energy Astrophysics.		**Type of Module:** elective
CP: (ECTS Credits)	6		
Workload: - **Time in Class** - **Self-Study**	Total workload: 180 h	Time in Class: 60 h / 4 SWS	Self-Study: 120 h
Duration:	1 Semester		
Frequency:	Winter Semester		
Language of Instruction:	English.		
Forms of Teaching and Learning:	Lecture with exercises.		
Content:	The module deals with the physics processes of the high energy Universe, from X-rays to Ultra High Energies. It includes a review of the basic concepts of radiation interaction and transport; all major radiative processes, from bremssstrahlung to synchrotron radiation and Compton effect; particle acceleration in the non thermal universe; production of cosmic neutrinos and cosmic rays. It also deals with the peculiar astrophysical environments in which high energy radiation is formed such as ionized plasmas, accretion disks, jets and shocks.		
Objectives:	The students will obtain knowledge on the physics of the high energy processes, on the relativistic approach to astrophysical processes, on the mechanisms of the non thermal Universe. They will learn how to describe and understand astrophysical situations in which high energy radiation and particles are produced. The students will solve a series of exercises and apply the methods presented in the lectures to deepen their understanding, and to treat new astrophysical problems with the same formalism.		

Requirements for Obtaining Credit, Grading, weight if appl.:

Module Components	Type of course	Status	CH	CP	Type of Exam	Length of Exam	Evaluation Type	Weight for Grade
Lecture	L	e	2	3	O	30	g	1.0
Exercises	E	e	2	3				

Transfer:	BSc in Physics, MSc Astro and Particle Physics.
Prerequisites:	The module requires knowledge of physics and mathematics at the level normally obtained at the end of the 4th semester of undergraduate studies in physics, mathematics, or engineering.

4 Module - Lecture - Dependencies

The following table provides the relation between elective modules and lectures, and indicates which lecture can be used for which module. The module APP104 „Modern Topics in Astro and Particle Physics“ consists of a seminar with 3 CP and a lecture with 3 CP. The lecture could be any of the following table. If you are unsure about a lecture that you would have expected to show up in the dependency table, please contact ch.schaefer@uni-tuebingen.de.

Lecture	Modules
Advanced Topics in Gravitation	APP204, APP205
Black Hole Astrophysics	APP204, APP205
Computational Astrophysics	APP202
Cosmology	APP213
Endpoints of Stellar Evolution: Supernovae, White Dwarfs, Neutron Stars, Black Holes	APP203, APP212
Exoplanets	APP206
Experimental Astro Particle Physics	APP216
Extragalactic Astronomy and Astrophysics	APP214
High Energy Astrophysics	APP212
Introduction to General Relativity	APP204, APP205
Introduction to Scientific Computing	APP202
Mathematical Relativity[1]	APP204
Neutrinophysics - Experiments and Theory	APP211
Numerical Hydrodynamics	APP202
Numerical Methods in Physics and Astrophysics	APP202
Observational X-ray Astronomy	APP212
Physics of Stellar Atmospheres	APP203
Planet Formation	APP206
Quantum Field Theory	APP221
Relativistic Astrophysics	APP204, APP205
Star Formation	APP203, APP206
Stellar Oscillations	APP203
Stellar Structure and Evolution	APP203
Theoretical Astrophysics	APP201

[1] Lecture from the department of Mathematics, Geometry in Physics/Differential Geometry is required.
